formed by fission or are aliens who have been adopted by a "parent" sib.

A sib is formed of patrilineal lineages that go back no more than three or four generations. Since a sib itself is small, a lineage is of minor importance. The most significant component units of a sib are the fraternal joint families and the nuclear households. A group of brothers of the same father are held together by very firm ties of common upbringing and regard themselves as very close to one another. The households of this fraternal group are distinguishable, not jurally but *de facto*, as separate entities within the sib. When a sib splits, it is the fraternal group that offers the most ready line of cleavage. Finally, there is the nuclear household, a most important unit that occupies its own "compartment" in the maloca, maintains its own hearth, and is capable also of asserting its autonomy. A nuclear household may break from the common residence group of the maloca and establish itself as an Independent, but that is about as far from the sib as it can go. It is not a truly self-sustaining unit. When it does break away, the separation is a consequence of serious disaffection, from the Cubeo point of view, an example of social pathology. Detached nuclear households often become vagrants, imposing upon the hospitality of related sibs.

What I have presented is an outline of Cubeo social organization that encompasses a descending order of subordinate and component segments, from tribe to nuclear household. There is another social concept that falls somewhat outside of this structure. That is the concept of community. The community is the common residence group, based, to be sure, upon the sib, but not exclusively so. Common residence creates its own norms of behavior.

THE COMMUNITY

The concept of community offers perhaps the most advantageous entry into the character of Cubeo social structure; it exemplifies almost all social relationships and relates them to the physical factors of location, economy, and material culture.

From the air, a community appears as a small semicircular island pressed against a thread of river in an otherwise unbroken expanse of tropical forest. The air view emphasizes the isolation and self-containment of each community. Along a well-populated river such as the Cuduiarí the communities resemble rough-shaped beads widely spaced along the thin strand of the sinuously curving river. The river literally binds the communities since, in the main, communities

614 193 tiated by a suffix. From the *Hehénewa* traditions it seems likely that they were originally an independent tribe, probably Tucano, that had joined in with the group of sibs that were headed by the *Órobawa* and the *Aúnbwawü*, bringing with them their associated sibs. The sibs that carry the *Hehénewa* stem with their descriptive prefixes are also known by names that are compounded of the prefixes as well. Thus, the *Byarí-Hehénewa* are also known as *Byarídowa*, and the *Pyéndo-Hehénewa* as *Pyéndowa*. According to Koch-Grünberg, the 614 *Órobawa* regard themselves as a branch of the *Hehénewa* and are also known as *Óluba-Hehénewa*. His information was that the *Hehénewa* were the "true" Cubeo and that the *Bahükiwa* were intrusive Macú (1909, II, 87). The actual history of the sibs is clouded in uncertainty. We can be reasonably sure only of a composite of several distinctive peoples or "tribes." The few *Wathariwa* sibs in my list are also named in a fashion similar to that of the *Hehénewa*.

614 551 Each sib also possesses a list of personal names that constitutes its traditional genealogy.[3] These are names that all sib members must bear. They are called *aínheme* (*aín*: anaconda; *heme*: tongue) to indicate their origin from the speech of the anaconda, the animal form in which all first ancestors emerged from the earth. In these names there is a note of prestige, in that some names are illustrious, being part of the earliest genealogies, while others, having been added later, are less important. Since only one name can be held at a time, names are allocated in order of seniority, but not, insofar as I know, within a senior line. Names with an honorific connotation circulate within [613] the sib, and not by lineage. They are transmitted in alternate gener- [424] ations, going from a deceased grandparent to a grandchild. It should be said at once that while the notions of sib rank and of the distinction between more honorific and less honorific names suggests a structured system of social status, the social significance of status hierarchy is not great. The Cubeo have the skeleton of an aristocratic system that is fleshed with an egalitarian ethos.

Personal names are often those of birds, insects, and beasts, less commonly of fish. In the recent past, it is said, sib members did not eat the flesh of any creature whose name was then being carried by a sib member. This taboo is no longer in force. The explanation given is that hunting is more important now and they do not wish to deprive themselves of animal meat.[4] Without a proper sib name,

[3] There is a list of *Bahükiwa* names at the end of this chaper.

[4] On the other hand, there is the tradition that in the past they lived by hunting, fishing, and gathering rather than by farming. If this taboo did indeed exist it may have lapsed for the same reason that other ceremonial observances have

615 614 the *Bahûkiwa* that intermarriage is possible. The *Bahûkiwa*, for their part, deny this. I could obtain, however, no record of a marriage between the *Bahûkiwa* and *Hehénewa*. I am inclined to attribute such discrepancies to considerations of prestige. The high-ranking *Hehénewa* emphasize distance, the low-ranking *Bahûkiwa*, closeness, between their respective sibs.

615 614 554 [301] The Cubeo phratry is particularly interesting because of its hierarchical organization. Ranked sibs suggest a hierarchical social structure and hence a political organization of some complexity. Neither, as we have already observed, is actually present among the Cubeo. Insofar as I could determine, the leading sibs of a phratry had no actual jurisdiction over any of the lower-ranking sibs, nor was there any formal way in which the rank order of sibs was expressed other than by listing, and by some prestige privileges that allowed only the high-ranking sibs, up to and including the *Hehénewa*, to wear the quartz cylinder pendant on their breasts. Among the low-ranking *Bahûkiwa* no one possessed the jaguar-tooth or the armadillo-vertebrae girdles either.

The hierarchy of sibs is consistent with a kinship stress upon seniority of birth that distinguishes older and younger siblings, but it seems at variance with a very strong feeling for equality, with the absence of deferential behavior, and with other marked symbols of social status. There are, nevertheless, intimations of rivalries within [177] the phratry among sib headmen, in which one accuses the others of seeking power over the phratry. White influence may be responsible for this, since the authorities hope to be able to deal with a single chief rather than with each small sib. Even so, it may well be that [721] the groundwork for phratric leadership has been laid down by the hierarchical organization. We do have a tradition that the *Hehénewa* once made an unsuccessful military effort to establish political authority over the entire Cuduiarí.

614 [613] The character of the Cubeo sib is such that it is a moot point whether we are dealing with a true patrilineal sib or with a patrilineage. From the Cubeo point of view, the descent group has lineage features. It is small, it is generally localized, its members have the strongest feelings of kinship identification, and they claim not merely descent from a common ancestor but they produce genealogies to establish such a connection. At some time during the year, an old [867] man gathers all the young males, from the age of six on, together in the evening and each night for a month teaches them the sib genealogy. The genealogies, however, begin from the past and never actually connect with the present. The interest of the Cubeo in present

CUBEO

genealogies is not strong, so that they have only a general, albeit a strong, feeling that the family lines presently in a sib are related. What keeps the sib from being a lineage is then the technical fact that the Cubeo cannot link up their present descent lines with their ancient descent lines.

One is tempted, therefore, to think of the Cubeo descent group as a transitional form, hovering between sib and lineage. At first glance the distinction between sib and lineage seems to hang by the technicality of how sophisticated a people are about genealogies. Yet this sophistication is a matter of major importance. Sib continuity and growth is a relatively simple matter of transmitting a sib name and a line of descent with an origin myth to give historical sanction. Lineage continuity and growth, on the other hand, demand motivation as well as the capability for maintaining accurate or presumably accurate genealogical records. Societies organized upon aristocratic lines can do this readily. Egalitarian societies, on the other hand, can have small lineages or large clans and kindreds but they cannot readily support large or historically deep lineages. The Cubeo have a shadow aristocracy only, not enough to sustain the necessary degree of genealogical sophistication. On the other hand, if the Cubeo could not sustain the growth of lineages neither could they sustain the growth of sibs. Two social conditions seemed to stand in the way of the enlargement of sibs. One was the inherent fissility of the sib, the other was the organization of the phratry. The phratry allowed the sibs to split without endangering their survival by virtue of being too small.

The basic social organization that provides for autonomous confederation of small units conforms readily to the requirements of easy absorption of new groups. The modes of group-binding, such as exogamy, the cycle of drinking parties, and the segmented forms of ceremonial participation that allow each sib to function as a ceremonial unit, are also admirably adapted to rapid assimilation of foreign tribes without benefit of a central administration. In cases of assimilation, all the necessary joint activities to which the sibs of a phratry are bound will inevitably encourage a common language. Just as the phratric organization allows for easy binding of autonomous sibs into a convenient fraternity that provides for peace, cooperation, and sociability, it allows as readily for fission without serious disruption. From these observations it may be inferred that the history of the Northwest Amazon region has been one of constant formation and disruption of sociopolitical entities. What a tribe is at any time is a core of sib segments that may have persevered through

term has apparently taken on a masculine meaning and *amikó* is used to specify the female. A term *amikû* does not exist to my knowledge. With the loss of the possessive prefix *hi* some of the intimacy has gone out of the term. Nevertheless, being diplomatic in their use of kinship terms, the Cubeo sometimes employ the form *himámiyo* and so give the term a warmer tone.

601 Finally, the most distant usage is to employ only the stem *mamû* ("older one") equally to male and female to connote the barest sibling relationship. I never heard this term used because, I suppose, [554] the Cubeo find it too formal. Rather than call a person *mamû* they [614] prefer the more cordial *pakomá* (kinsman). The special respect use of this term for men of the head sib has already been described.

601 The junior sibling term is rather unusual. I am inclined to regard 561 it as a quasi-kinship term because it has equally a kinship and an age-grade connotation. *Hwainyó* means literally "one who is in the class of youths." Like *amiyó* it can refer to females, but *hwainkó* is the special term for a younger sib and phratry sister. Because it is an age-grade term, the kinship meaning of *hwainyó* is so wide that it has come to mean any person of sib or phratry who is younger either by relative age within one's generation or is of a younger generation. When it is used as the reciprocal for *amiyó*, as a respect term, it refers to one to whom one condescends somewhat as a donor or good Samaritan. It would seem that the Cubeo have developed only the senior term as a true kinship term and have given seniors the prerogative of addressing all their juniors, whether by age or status, simply as "youth." Nor is the term bound by phratry, since it is applied to all grandchildren (male or female) who are not of the lineage. *Hwainyó* also means son-in-law and any nephew or niece. *Hwainkó* is the daughter-in-law. *Hwankû* is a serviceable male form giving it somewhat greater intimacy and thus is limited generally to younger men of one's own sib or of closely related sibs. The abbreviated form *hwa*, a more jocular term, is also used.

614 ## BROTHER-SISTER RELATIONSHIP
● 613
602

Lineage brothers and sib brothers are joined by all the strong bonds of a localized patrilineal sib organization. The obligations of lineage brothers toward one another are very little less binding than those of blood brothers, and the obligations of sib brothers, while [593] somewhat less binding, are still considered to be strong. But these brotherly ties are general and taken for granted, whereas the relationship between brother and sister, as indeed that between husband

5: Goldman E-5 (1939-1940) 1963
SQ19 Tucano SQ19
CUBEO

and wife, is based upon complementarity. Complementarity of necessity entails more precisely structured relationships than does a homologous relationship as prevails particularly among brothers, the importance of seniority notwithstanding.

Among the Cubeo, the brother-sister relationship is modeled rather closely upon the husband-wife relationship, particularly in respect to forms of economic reciprocity. Even in sexual respects there appears to be a quasi-conjugal relationship. The conjugal division of labor is that a man clears a garden and his wife cultivates it. He provides fish and game, she provides the staple, manioc. She brings in forest products that can be gathered, such as grubs, ants, wild fruits, and he supplements it further by such extra cultivations as pupunha, sugar cane, squash, gourd, coca, tobacco, and *mihi*. She makes pottery and he basketry. Under more modern conditions the women secure trade goods from the whites by bartering farinha, while the men barter their labor in the rubber forest for trade goods. The women acquire, in the main, trade goods for themselves, but will always barter something for a husband, son, or brother. Similarly, a man works primarily for his own wants, such as a muzzle-loading shotgun, but will always take part of his wages in goods for his wife, daughter, or sister.

To carry this account of sexual economic complementarity further, we might add that the women prepare all the regular everyday meals while the men take over the food preparation – with the assistance of the women – for the great events when big game (e.g., tapir) or a spectacular catch of fish has been brought in. In ceremonial life it is the role of the men to astonish the women with the mysteries of the ancestor cult and the role of the women to be astonished. One of the functions of ceremonies that maintain mystery between the sexes is to augment the tension of complementarity.

Sexual complementarity is an aspect of adult status. The young are attached to generalized groups only, the boys in a young male pack that attaches itself only loosely to the adult males, while the little girls are charged with household chores under the direction of their mothers. Adult status is reached by a woman when she has a manioc garden of her own, by a man when a woman is cultivating particularly for him. From this point of view, full adult status is gained only at marriage. The Cubeo brother-sister relationship provides for adult status in advance of marriage and, as we shall see, serves to facilitate marriage and often to protect the stability of marriages. Above all, the brother-sister relationship seems to satisfy a very strong need for particularized relationships.

5: Goldman E-5 (1939-1940) 1963

CUBEO

One informant explained that the feathers have power that may be too strong for the owner and that is why it is better not to have too much. Some men accumulate outfits of *mápena*. They are certain to die from overdoing, it is said. A host at a drinking party may lay out his *mápena* in a tray at the doorway so that guests may wear them for dancing. It is a point of pride to be able to supply guests in this way. He addresses a guest as follows: "Here it is now, this poor thing that I have. When you put this on you may drink. Our ancestor wore this when he made chicha to drink. He became sick when he did this, when he adorned himself. Other people know how to make this [*mápena*]. He bought it from them."

The girdles of jaguar teeth and of armadillo vertebrae were also possessed only by the *Hehénewa*. They are worn only during ceremonial dances. These girdles are symbols of shamanistic power although they are not shamanistic insignia. The jaguar is, of course, the full-fledged shaman himself. The armadillo claw forms the handle on the special rattle a shaman uses to bring rain. The quartz cylinder (*kenádox*: stone) may also be a shamanistic symbol since stone crystals are part of the medicine man's equipment. But whatever its symbolic significance, it is for the Cubeo the ornament of major prestige, limited to the high-ranking sibs. The quartz from which this pendant is laboriously made and drilled is found, I was told, only on the Tiquié River and is widely traded in the region. The *Hehénewa* claim that their first ancestors brought the *kenádox* with them and that is why they alone may wear them. Koch-Grünberg found these pendants to be widespread among the Tucano, where even children wore them.[1]

HEADMANSHIP

The headmanship, whether of *habókü* status or *kenámi upükü*, normally stays within a particular lineage, although no lineage has a specific and traditional claim to the office. The office may go from a father to his eldest son or from a man to his next younger brother, depending upon circumstances and upon which of these pushes himself forward most effectively. Koch-Grünberg observed that among

[1] Martius (1867, I, 599 ff.) observed that the quartz cylinder is a special trait of the Vaupés. He put the source of the stone at the Apaporis and Caquetá rivers and reported that it took two generations to make a pendant. The stone is ground into shape with volcanic ash obtained from the Solimoes River and the hole is bored with a bamboo drill. He saw chiefs on the Vaupés who wore pendants drilled through the long way, an exceptional mark of high status. The size of the pendant, according to Martius, was in proportion to the deeds of the wearer in war and in the hunt.

5: Goldman E-5 (1939-1940) 1963
SQ19 Tucano SQ19
CUBEO

the Tucano Indians of the Vaupés, succession was from father to son, while on the Aiarí it went from brother to brother (1909, I, 68). The Cubeo combine both methods. The tendency of the headmanship to stay within a lineage conforms to the natural tendencies of sons to model their behavior on their father, and for a group of brothers, who form among the Cubeo a particularly intimate sibling group, to share common interests. Thus, the men of a chiefly lineage behave with a greater sense of responsibility for the welfare of the sib; they follow the pattern of giving and act generally to maintain high morale. If the prospective heirs fail to live up to expectations they cannot succeed to the office. The office is not their automatic due, although coming from a chiefly lineage, their chances for the office are very much enhanced. Competition for the office is regarded as unseemly. Since the Cubeo are most sensitive in their distrust of the authoritarian personality, an overeager contender for the headmanship would most likely jeopardize his chances.

In the case of the headman who is known only as "owner of the house," the model of leadership is, as the title denotes, paternal. His warrant of office is that it is he who has built the maloca. A changeover in the headmanship comes with the building of a new maloca, when a headman has died or when the old maloca needs to be replaced either because of its deteriorated condition or because new manioc gardens need to be planted at a new site. On those occasions, the man who feels confident of his support undertakes to put up the main beams of the new house, with the help of his own brothers and of his sons. For the reasons already cited this man is most likely to be of a line of headmen. When the main posts are in place, the other household heads of the sib are invited to join in the work of completing the house. Those who join will be residents who accept the leadership and authority of the new headman. No man is compelled to join. He may declare himself an Independent, saying he will build his own house. The building of a maloca constitutes an election – one that occurs every five years or so, the period of duration of a house and of a manioc clearing. A headman who has grown unpopular will then find himself replaced, often by a brother or a son. It is as "owner of the house" that the headman is giver, guide, and keeper of order. He is in charge of the hospitality of the house, the receiver of guests, and the main organizer of drinking parties. He is responsible for ceremonies and for all ceremonial equipment, including tobacco, coca, and *mihí*. He is chairman of discussions and arbiter of disputes. He has no authority to order punishment, although his opinion as to punishment carries weight.
